Product Description

Fixed Rubber Coated Barbell, Long Bar Barbell, Curved Bar Barbell, Integrated Straight Bar Curved Bar Barbell

Integrated straight and curved bar barbell is a type of barbell that combines the characteristics of straight and curved bars. It usually consists of a continuous rod, and barbell plates can be installed at both ends of the rod.

The design of this barbell is aimed at providing more training options and variations. The straight bar section is suitable for traditional barbell training exercises such as squats, push ups, and hard pulls, which can effectively exercise the large muscle group. The curved part can change the angle of the wrist, reduce the pressure on the wrist, and better stimulate specific muscle groups in some movements.

Here are some advantages of using an integrated straight bar and curved bar barbell:

Multifunctionality: It can perform various training actions to meet different training needs.

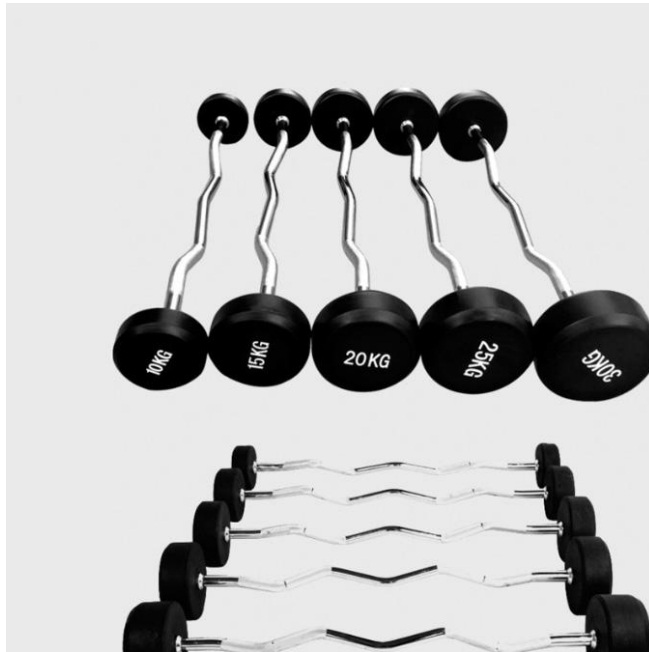

Reducing wrist pressure: The design of the curved shaft helps to alleviate discomfort in the wrist, especially suitable for those who are prone to wrist pain.

Increasing muscle stimulation: By changing the angle of the wrist, it can better stimulate the muscles and promote their growth and development.

Space saving: Compared to having straight and curved barbells separately, the integrated design takes up less space and is more convenient for storage and use.
